

SOLUTION

**Exp. II-A : Light Response of the Photoconductor**

(1) Record the measured PC resistance ( $R$ ) and  $\theta_p$  in the data table. Transform the measured  $R$  values into conductance ( $C$ ) values and record them in the data table.

$\theta_p$ (degree)	$R(\Omega)$	$C(1/\Omega)$	$J = \cos^2 \theta_p$

180.0	1320	7.576E-04	1.00	

SOLUTION

(2) Plot the PC conductance values as a function of  $\theta_P$  on a graph paper.

SOLUTION

**Exp. II-B : The Fraction of Linearly Polarized Laser Light**

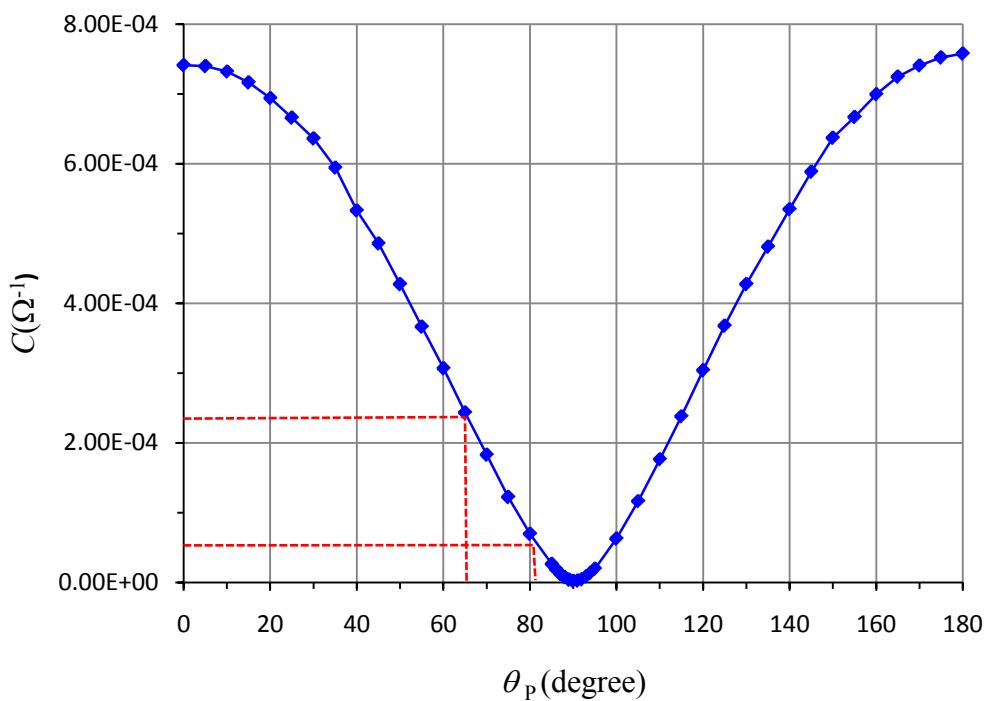

- (1) Find the maximum and minimum values of PC resistance ( $R_{max}$  and  $R_{min}$ ) by rotating P1 360 °. Transform  $R_{max}$  and  $R_{min}$  into the minimum and maximum values of PC conductance  $C_{min}$  and  $C_{max}$ . Record the data in the data table.

$R_{min}$ (kΩ)	$R_{max}$ (kΩ)	$C_{max}$ (1/kΩ)	$C_{min}$ (1/kΩ)		
4.30	19.40	0.233	0.0515		
4.28	19.42	0.234	0.0515		
4.31	19.41	0.232	0.0515		
	Average	0.233	0.0515		

SOLUTION

(2) Utilizing the conductance versus  $\theta_p$  graph in Exp. II-A-(2) to determine the relative intensities  $J_{max}$  and  $J_{min}$  corresponding to  $C_{max}$  and  $C_{min}$ . Write down the result.

$$C_{min} = 0.0515 \Omega^{-1} \Rightarrow \theta_p = 81^\circ \Rightarrow J_{min} = \cos^2 81^\circ = 0.025$$

$$C_{max} = 0.233 \Omega^{-1} \Rightarrow \theta_p = 65^\circ \Rightarrow J_{max} = \cos^2 65^\circ = 0.18$$

$J_{min} = 0.025$

$J_{max} = 0.18$

SOLUTION

(3) Calculate  $\beta$  and write down the result on the answer sheet.

$$\beta = \frac{J_{\max} - J_{\min}}{J_{\max} + J_{\min}} = \frac{0.18 - 0.025}{0.18 + 0.025} = 0.76$$

$\beta = 0.76$

SOLUTION

**Exp. II-C : The Differential Quantum Efficiency of the Collimated Laser Diode**

(1) Control the CLD current ( $I$ ) and measure the corresponding PC resistance ( $R$ ) values.

Record the data in the data table. Transform your data and plot the PC conductance ( $C$ ) versus CLD current on a graph paper.

$I$ (A)	$R$ ( $\Omega$ )	$C$ ( $1/\Omega$ )	$J$

## SOLUTION

SOLUTION

(2) Based on the graph of step (1), choose a region ( $\Delta I \sim 3 \text{ mA}$ ) centered around the maximum slope. By using the conductance versus  $\theta_p$  graph in Part II-A-(2), transform and record the data of this region in the table of step (1) into the relative light intensity ( $J$ ). Plot the relative light intensity ( $J$ ) versus CLD current ( $I$ ) in a graph paper.

SOLUTION

(3) The maximum radiating power of the CLD is assumed to be exactly  $P_{\max} = 3.0 \text{ mW}$ . Extract the maximum slope from the graph in step (3) and transfer it to the value of  $G \equiv \left. \frac{\Delta P}{\Delta I} \right|_{Max}$ , which is the maximum ratio of the increased amount of radiating power and the increase amount of input ampere. Write down your analysis and the calculated value  $G$  on the answer sheet. Estimate the error of  $G$ . Do not include the error of the  $P_{\max}$ . Write down your analysis and the calculated value  $\Delta G$  on the answer sheet.

$$G = \left. \frac{\Delta P}{\Delta I} \right|_{Max} = 0.69 \text{ W/A} \quad \Delta G = 0.02 \text{ W/A}$$

By linear regression analysis,

slope  $S = 213$  (Intensity Unit /A), uncertainty of slope  $\Delta S = 3$  (Intensity Unit /A).

$$P_{\max} = 3.0 \text{ mW} \Rightarrow J_{\max} = 0.92 \text{ (Intensity Unit)}$$

$$\because P \propto J \Rightarrow P = kJ$$

$$\therefore G = \left. \frac{\Delta P}{\Delta I} \right|_{Max} = \left. \frac{k \Delta J}{\Delta I} \right|_{Max} = \frac{P_{\max}}{J_{\max}} \cdot \left. \frac{\Delta J}{\Delta I} \right|_{Max} = \frac{3.0 \times 10^{-3}}{0.92} \times 213 = 0.69 \text{ W/A}$$

From the measured data, uncertainty of  $J_{\max}$  :  $\Delta J_{\max} = 0.02$  (Intensity Unit)

Uncertainty Analysis: by using the formula of error propagation

$$G = G(S, J_{\max}) = \frac{P_{\max}}{J_{\max}} \cdot \left. \frac{\Delta J}{\Delta I} \right|_{Max} = (3.0 \times 10^{-3}) \frac{S}{J_{\max}}$$

$$\Delta G = \sqrt{\left( \frac{\partial G}{\partial S} \right)^2 (\Delta S)^2 + \left( \frac{\partial G}{\partial J_{\max}} \right)^2 (\Delta J_{\max})^2} = \sqrt{\left( \frac{3.0 \times 10^{-3}}{J_{\max}} \right)^2 (\Delta S)^2 + \left( -\frac{3.0 \times 10^{-3} S}{J_{\max}^2} \right)^2 (\Delta J_{\max})^2}$$

$$= \sqrt{\left( \frac{3.0 \times 10^{-3}}{0.92} \right)^2 (3)^2 + \left( -\frac{3.0 \times 10^{-3} \times 213}{0.92^2} \right)^2 (0.02)^2}$$

$$= 0.02$$

Alternatively,

$$\frac{\Delta G}{G} = \sqrt{\left( \frac{\Delta S}{S} \right)^2 + \left( \frac{\Delta J_{\max}}{J_{\max}} \right)^2} \Rightarrow \Delta G = 0.69 \sqrt{\left( \frac{3}{213} \right)^2 + \left( \frac{0.02}{0.92} \right)^2} = 0.02$$

SOLUTION

(4) The **Quantum Efficiency** equals the probability of one photon being generated per electron injected. From a particular bias current of the laser, a small increment of electrons injected would cause a corresponding increment of photons. The **Differential Quantum Efficiency  $\eta$**  is defined as the ratio of the increased number of photons and the increased number of injected electrons. Determine  $\eta$  of your CLD by using the value of  $G$  obtained in step (4). Write down your analysis and the calculated value  $\eta$  on the answer sheet. Estimate the error of  $\eta$ . Write down your analysis and the calculated value  $\Delta\eta$  on the answer sheet. (Laser wavelength = 650 nm. Planck's constant =  $6.63 \times 10^{-34} J \cdot s$ . Light speed =  $3.0 \times 10^8 m/s$ )

$$\eta = 0.36$$

$$\Delta\eta = 0.01$$

$$\begin{aligned}\eta &= \frac{\Delta N_{\text{photon}}}{\Delta N_{\text{electron}}} = \frac{\Delta P / E_{\text{photon}}}{\Delta I / e} = \frac{\Delta P}{\Delta I} \cdot \frac{e}{E_{\text{photon}}} = G \cdot \frac{e}{hc / \lambda} = \frac{Ge\lambda}{hc} \\ &= \frac{0.69 \times 1.6 \times 10^{-19} \times 650 \times 10^{-9}}{6.63 \times 10^{-34} \times 3.0 \times 10^8} = 0.36\end{aligned}$$

$$\Delta\eta = \Delta G \frac{e\lambda}{hc} \Rightarrow \frac{\Delta\eta}{\eta} = \frac{\Delta G}{G} \Rightarrow \Delta\eta = \eta \left( \frac{\Delta G}{G} \right) = 0.36 \times \left( \frac{0.02}{0.69} \right) = 0.01$$
